Mini Purifier P4

Your Partner in Lab for Automated Nucleic Acid Extraction

Technology: Magnetic Bead-based

To automatically complete the nucleic acid extraction from specimens, silica coated magnetic beads are used to adsorb, transfer, and purify nucleic acids. Magnetic beads with a unique separation system can rapidly extract high-purity DNA/RNA from biological/clinical specimens with high sensitivity and efficiency. The extracted nucleic acid can be used for enzyme digestion, reverse transcription (cDNA synthesis), PCR, RT-PCR, southern blot, and other common molecular experiments.

Mechanism of Action

Microcyn Technology replicates one of the body's own defense mechanism against pathogens: Foreign substances are not eliminated chemically, but are destroyed by a purely natural, physical process. The decisive factor is the essential ingredient, hypochlorous acid (HOCl). It is an important component of the body's innate immune system.

1. Disruption of the cell wall

Microcyn Technology formulated Solution surrounds single-celled microorganisms. The hypochlorous acid attacks the cell wall of the microorganisms and increases its permeability. Since our body's own cells have the necessary processes to prevent cell damage, they are not destroyed.

2. Osmolysis bursting of the cells

The hypertonic Microcyn Solution ensures that water increasingly flows into the cells to equalize the osmotic gradient. The result is osmolysis: The increasing internal pressure causes the cells to burst. This purely physical effect ensures a highly effective reduction in pathogen load.

Microcyn Technology is Effective against Gram-Positive and Gram Negative Bacteria (including MRSA), Viruses, Fungi, Spores and Bio-films.

Microcyn Technology Kills **99.99%** of all Relevant Pathogens after just **30 Seconds**.

Ready-to-Use Generic 360-HCP ELISAs

BioGenes offers a wide variety of sophisticated products for host cell protein (HCP) determination. Compared to standard HCP assays, our enhanced generic 360-HCP approach:

- Is designed to cover a wider HCP spectrum
- Allows cost-effective testing of biologics in developmental phases
- Can be used until a more informed prediction is possible which determines the use of a product-specific HCP in late stages of development
- Is applicable for testing prior to lot release
- Provides sufficient stock amounts of antibodies and kit reagents to ensure functionality of all kit components throughout the entire product life cycle
- Prolonged delivery of ELISA kit components can be offered upon request

HemaVision

Detect translocations
in just 4 hours.

Introduction

HemaVision®-28Q is a RT-qPCR based assay (Reverse Transcription followed by Real-Time PCR) for detection of leukemia associated fusion gene transcripts in total RNA from whole blood or bone marrow samples.

HemaVision®-28Q provides a rapid screening for 28 translocations with more than 145 clinically relevant chromosomal breakpoints. Both common and rare translocation breakpoints and alternative splice variants are detected in only 4 hours from RNA extraction.

The kit screens for rare translocations and fusion products, which cannot be detected with other commercial screening kits.

How the test works?

The starting material for the HemaVision tests is total RNA extracted from whole blood or bone marrow.

RNA is added to a ready-to-use HemaVision® 28Q cDNA reaction tube and incubated for 1 hour.

cDNA template is transferred to each of the pre-mixed HemaVision® 28Q PCR reaction tubes.

Run a qPCR in a real-time PCR instrument for 2.5 hours using FAM, ROX, and Cy5 channels.

The test is completed in 4 hours after RNA extraction.
